Tabstop Accessibility Reports

Website Accessibility Audit Report

https://www.stronglawattorneys.com/ · scanned 2026-11-11 · 10 page(s) at desktop (1366px) and mobile (390px) widths · standard: WCAG 2.1/2.2 Level AA

Summary

200	0	200	0	4
WCAG issue instances	critical	serious	moderate / minor	distinct problems

The most important problems to fix first are: **elements must meet minimum color contrast ratio thresholds** (106); **keyboard focus is not visible** (84); **page scrolls sideways at 320px width** (6). Fixing a shared template (header, footer, product card) usually fixes the same issue on every page at once.

An “instance” is one element on one page; the same element found at both screen widths is counted once. Severity follows axe-core’s impact rating: **critical** blocks some users entirely, **serious** causes significant difficulty, **moderate**/**minor** cause friction.

Findings — WCAG failures, most severe first

SERIOUS **1. Elements must meet minimum color contrast ratio thresholds**

106 instance(s) · WCAG 1.4.3 Contrast (Minimum) (Level AA)

Text is too faint against its background. People with low vision, older visitors and anyone on a phone in sunlight may not be able to read it. WCAG AA requires a contrast ratio of at least 4.5:1 for normal text and 3:1 for large text.

> **How to fix:** Darken the text or lighten the background until the ratio reaches 4.5:1 (3:1 for text 24px+ or 18.66px+ bold). The exact colours and measured ratio are listed per element below; a free checker such as WebAIM's contrast checker shows a passing shade.

...and 100 more instance(s); the full list is in the JSON file delivered with this report.

SERIOUS **2. Keyboard focus is not visible** 84 instance(s) · WCAG 2.4.7 Focus Visible (Level AA)

When a keyboard user tabs onto these elements nothing visibly changes, so they cannot see where they are on the page.

> **How to fix:** Do not remove the browser outline. Add a clear focus style, e.g. a:focus-visible, button:focus-visible, input:focus-visible { outline: 3px solid #1a5fb4; outline-offset: 2px; }.

SERIOUS **3. Page scrolls sideways at 320px width** 6 instance(s) · WCAG 1.4.10 Reflow (Level AA)

At a 320px-wide screen (a small phone, or a desktop zoomed to 400%) the page scrolls sideways, so people who zoom must scroll in two directions to read each line.

> **How to fix:** Find the over-wide element listed below and give it max-width: 100% (images, iframes, tables: max-width:100%; height:auto; or wrap tables in a scroll container).

Pages: /states-hub (1), /services/alaska-personal-injury-lawyer (1), /services/alaska-car-accident-lawyers (1), /services/alaska-catastrophic-injury-lawyers (1), /services/alaska-motorcycle-accident-lawyers (1), /services/alaska-pedestrian-accidents-lawyer (1) · found at mobile 320px width · detected by reflow-320px

Best-practice recommendations

These are not WCAG failures on their own, but fixing them makes the site noticeably easier to use with a keyboard or screen reader.

BEST PRACTICE **5. All page content should be contained by landmarks**

788 instance(s) · not a WCAG success criterion

Some content sits outside any landmark (header, nav, main, footer), so screen-reader users who move by landmarks can miss it.

> **How to fix:** Place all content inside <header>, <nav>, <main> or <footer> (or an element with an equivalent role).

Pages: www.stronglawattorneys.com (112), /contact-us (14), /services (15), /about-us (65), /states-hub (52), /services/alaska-personal-injury-lawyer (103), /services/alaska-car-accident-lawyers (115), /services/alaska-catastrophic-injury-lawyers (102), /services/alaska-motorcycle-accident-lawyers (107), /services/alaska-pedestrian-accidents-lawyer (103) · found at desktop, mobile width · detected by axe-core rule region

BEST PRACTICE

6. Heading levels should only increase by one

12 instance(s) · not a WCAG success criterion

Heading levels skip (e.g. an H2 followed by an H4), which makes the page outline confusing for people who navigate by headings.

> **How to fix:** Use heading levels in order (H1 → H2 → H3) and style them with CSS rather than picking a level for its size.

...and 6 more instance(s); the full list is in the JSON file delivered with this report.

BEST PRACTICE **7. No "skip to content" link** 9 instance(s) · WCAG 2.4.1 Bypass Blocks

The first thing the Tab key reaches is not a "skip to content" link, so keyboard users must tab through the whole header and menu on every page.

> **How to fix:** Add Skip to main content as the first element in <body>, visible on focus, and id="main" on <main>.

Pages: www.stronglawattorneys.com (1), /contact-us (1), /services (1), /about-us (1), /services/alaska-personal-injury-lawyer (1), /services/alaska-car-accident-lawyers (1), /services/alaska-catastrophic-injury-lawyers (1), /services/alaska-motorcycle-accident-lawyers (1), /services/alaska-pedestrian-accidents-lawyer (1) · found at desktop width · detected by tab-traversal

...and 3 more instance(s); the full list is in the JSON file delivered with this report.

BEST PRACTICE

9. Landmarks should have a unique role or role/label/title (i.e. accessible name) combination

1 instance(s) · not a WCAG success criterion

Two landmarks of the same type have the same name, so they cannot be told apart.

> **How to fix:** Give each one a distinct aria-label (e.g. "Main menu", "Footer menu").

Pages: www.stronglawattorneys.com (1) · found at desktop, mobile width · detected by axe-core rule landmark-unique

www.stronglawattorneys.com · desktop

`.homeHeroSwiper`

```
<div class="swiper homeHeroSwiper slider w-slider" role="region" aria-label="carousel">
```

The landmark must have a unique aria-label, aria-labelledby, or title to make landmarks distinguishable

Keyboard and zoom checks

We pressed Tab through each page (up to 70 stops) and recorded where focus went, whether it was visible, and whether it got stuck. We also narrowed the window to 320px (equivalent to 400% zoom) to test reflow.

Page	Tab stops	Skip link first	Stops with no visible focus	Focus trap	Reflow at 320px

What this report cannot tell you

Automated testing reliably catches a large share of common, objectively testable problems (missing alt text, missing labels, contrast, missing names, language, some structure) — industry data puts it at roughly half of real-world issues by volume — but it **cannot** judge:

- whether alt text and link text are *meaningful* (only whether they exist);
- whether the reading and focus order make sense, or whether every task can be completed by keyboard (we test Tab movement, not every interaction);
- how the site behaves with real screen readers (JAWS, NVDA, VoiceOver) and voice control;

- captions and transcripts for video/audio content, or the accessibility of PDFs and third-party widgets inside iframes (booking, chat, payments);
- error handling and instructions in multi-step forms and checkout;
- pages behind a login, or states that only appear after interaction (menus, modals, validation messages).

A clean automated result is therefore **not** evidence of WCAG conformance. For a full conformance assessment, combine these fixes with manual testing by a person using assistive technology.

Tabstop Accessibility Reports · Report generated with axe-core 4.10.2 (Deque Systems, MPL-2.0) and scripted Chromium checks on 2026-11-11. Results reflect the pages as they loaded at scan time.
